The JD Eee Z harrows work with traditional footing blend, sand and felt additives, as well as specialty or treated sands.

The “rack” system that the S-tines are attached to, is a “link and lever” system with up and down action to keep the tines at the optimal angle for proper tooth entry at all times, regardless of depth adjustment. The design has an improved pattern of tooth spacing and tooth entry which, in turn, delivers exceptional rotation of the material through the S-tines, consistency and ground coverage.

Depth adjustment capabilities of the “rake” for the JD Eee Z harrows is zero to approximately 7 inches . Adjusting the depth with the turnbuckle or optional hydraulics allows the operator complete control.

The rear float pan smooths and levels behind the tines to leave the newly conditioned footing with a finished surface and light surface compaction. The Float Pan has six different height adjustment levels and can be removed and replaced with a paddle wheel or mesh roller option.

Because the harrow rides on tires, depth control can remain consistent to the operator’s settings and affording additional protection from gouging to the base. The wide flotation tires also help avoid compaction caused by narrower or deep tread tires.

The JD Eee Z is available with 2 rows, 3 rows or 4.5 rows of S-tines. Additional rows of tines minimizes time spent harrowing the arena, as well as providing additional cutting coverage. The 3 and 4.5 row harrows are considered “professional” models.
