The JD Water Roller is the ideal piece of equipment to ready your arena for wet weather or to tighten loose footing.

With all arenas (or pasture maintenance), you need to control the air pockets for wet to dry versatility. By adding a water roller (water filled to achieve desired weight) to your maintenance program, you can tighten up the surface (compress the air out), which will allow more water to runoff of the arena surface during wet weather. Controlling water runoff means less percolation—less percolation means your arena will dry faster and you will have less down time.

The Water Roller can be pulled by the tractor alone or, with adequate horsepower, in tandem with your harrow.
