

## RED MASTER PULVERIZER

The Red Master Pulverizer was primarily designed for use in clay soils and sand mix (non-base ) arenas or race tracks.

This harrow will provide deep cutting action to maintain the current 'cush' in already maintained footing, or aggressively cut and loosen the toughest of compacted soils and sands.

Each blade can be adjusted from a zero to four inch depth.

The offset pattern of blades will provide a well-worked and even cutting coverage.

The 8ft. Pulverizer is equipped with 22 cutting blades within 3 rows, and the 6ft. Pulverizer has 17 cutting blades within 2 rows.

The cutting plow steel blades have 3 inches of hard-facing to reduce wear to the tip and maintain a sharp cutting edge for as long as possible.

To set the cutting depth, we recommend that you set the roller on a leveled 2x4 for ground clearance. Then loosen the screws and drop the shanks onto a flat surface. To fine tune the shank depth, simply lengthen or shorten the top link of the three-point hitch to raise or shorten the shank depth into your footing.

In perfect partnership with the cutting shanks, the Till & Pack rings will break up clods, firm the surface, and accurately control the pre-adjusted cutting depth of the shanks.

Following behind the Till & Pack, is a smoothing bar to level the surface area to an excellent finish.

The Red Master Pulverizer comes equipped with a tow hitch, allowing the operator to simultaneously pull a Red Roller (page 7 ) for all weather maintenance. Additional HP may be required.

The Red Master Pulverizer is available in 6 foot size which will require 37+ HP, and an 8 foot size which will require 42+ HP.
